

Stick Insect Family Album

Mum and the kids

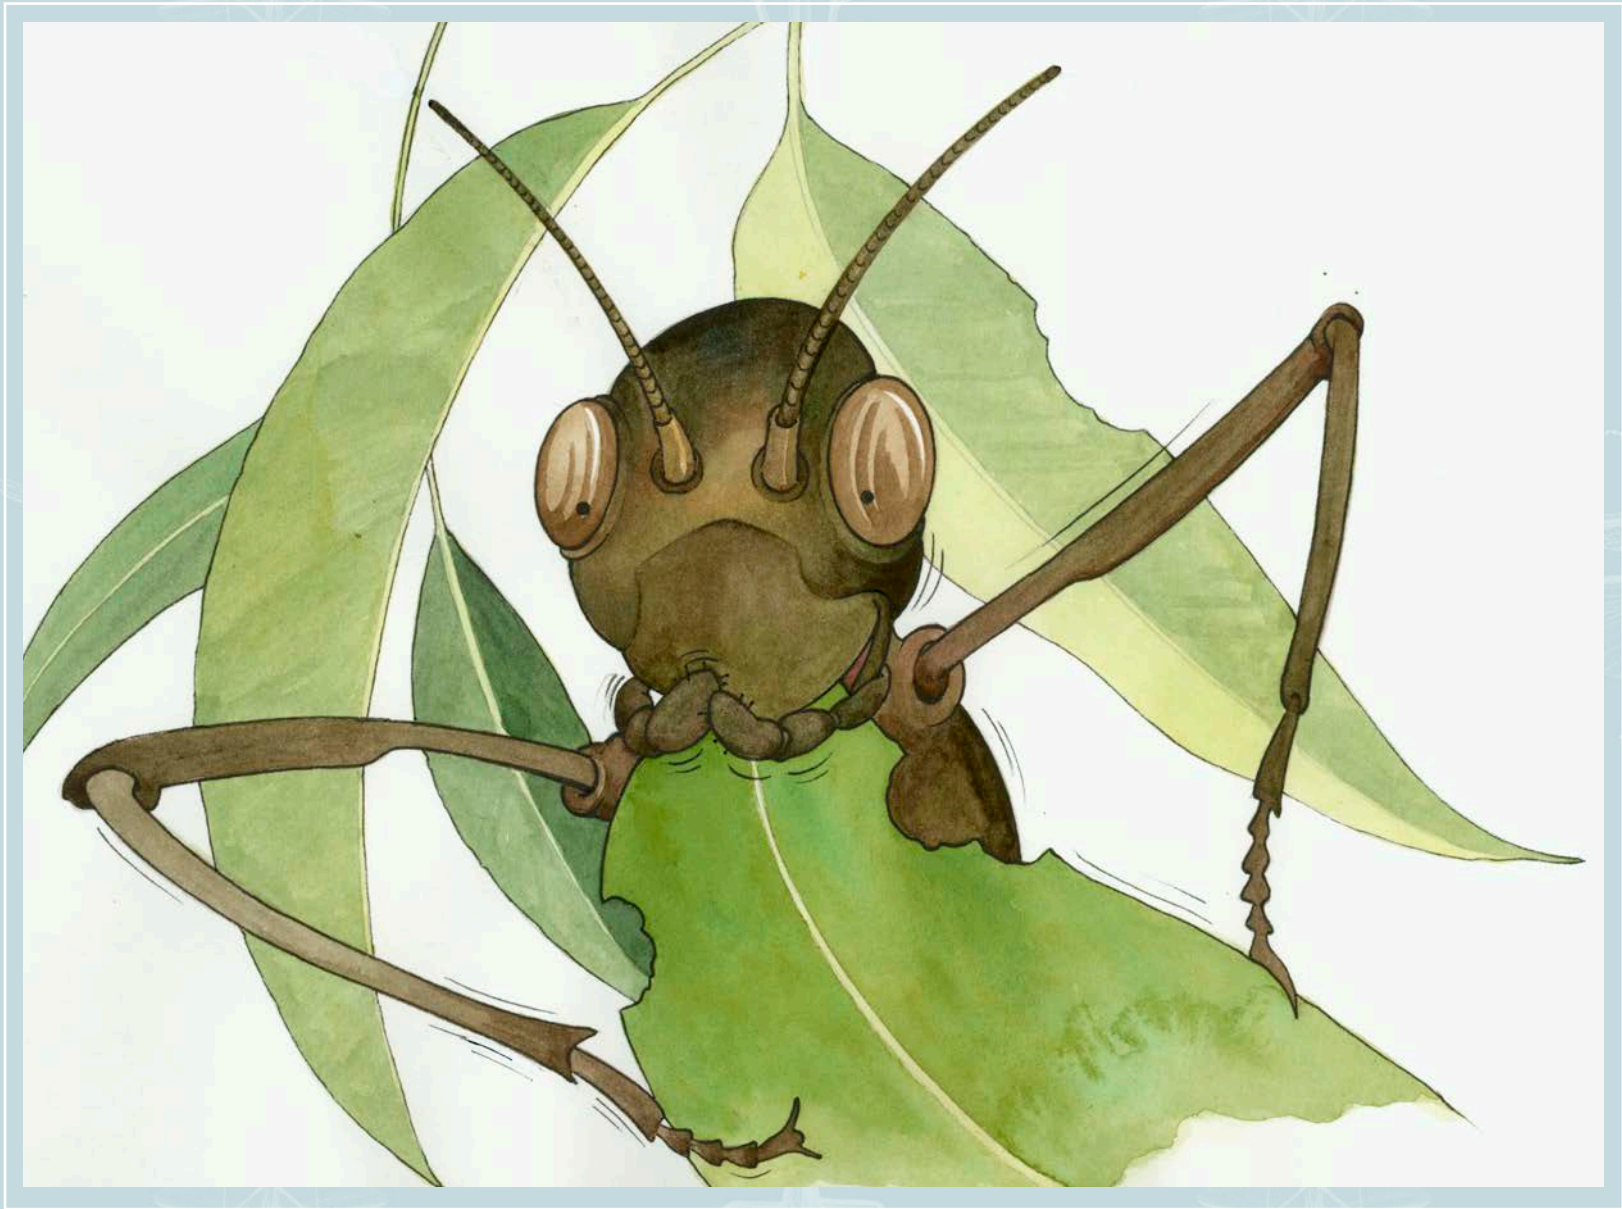

Stick Insect females can lay hundreds of eggs in their lifetime.

Now I've grown bigger
I can eat big leathery leaves

When they are young Stick Insects
can only eat the soft new leaves.

Get together with the rels.

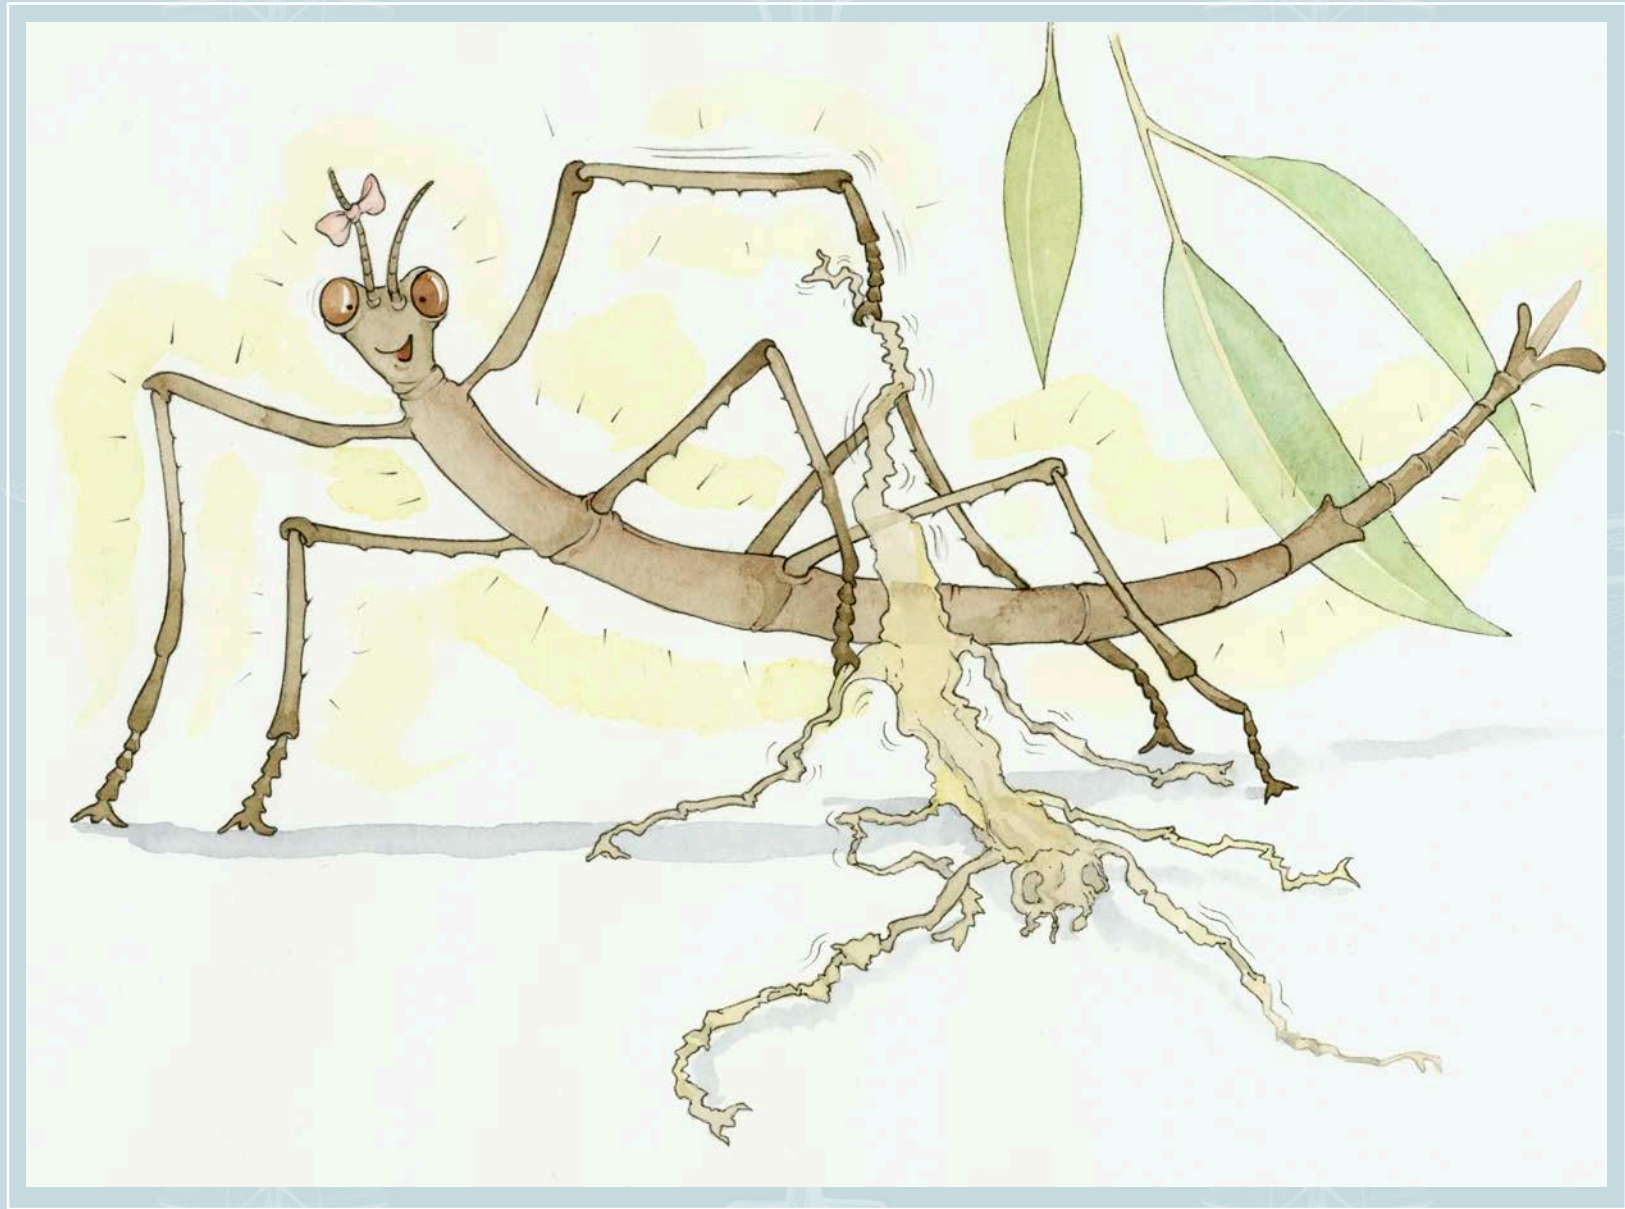

Australia has 150 species
of Stick and Leaf Insects.

My new outfit.

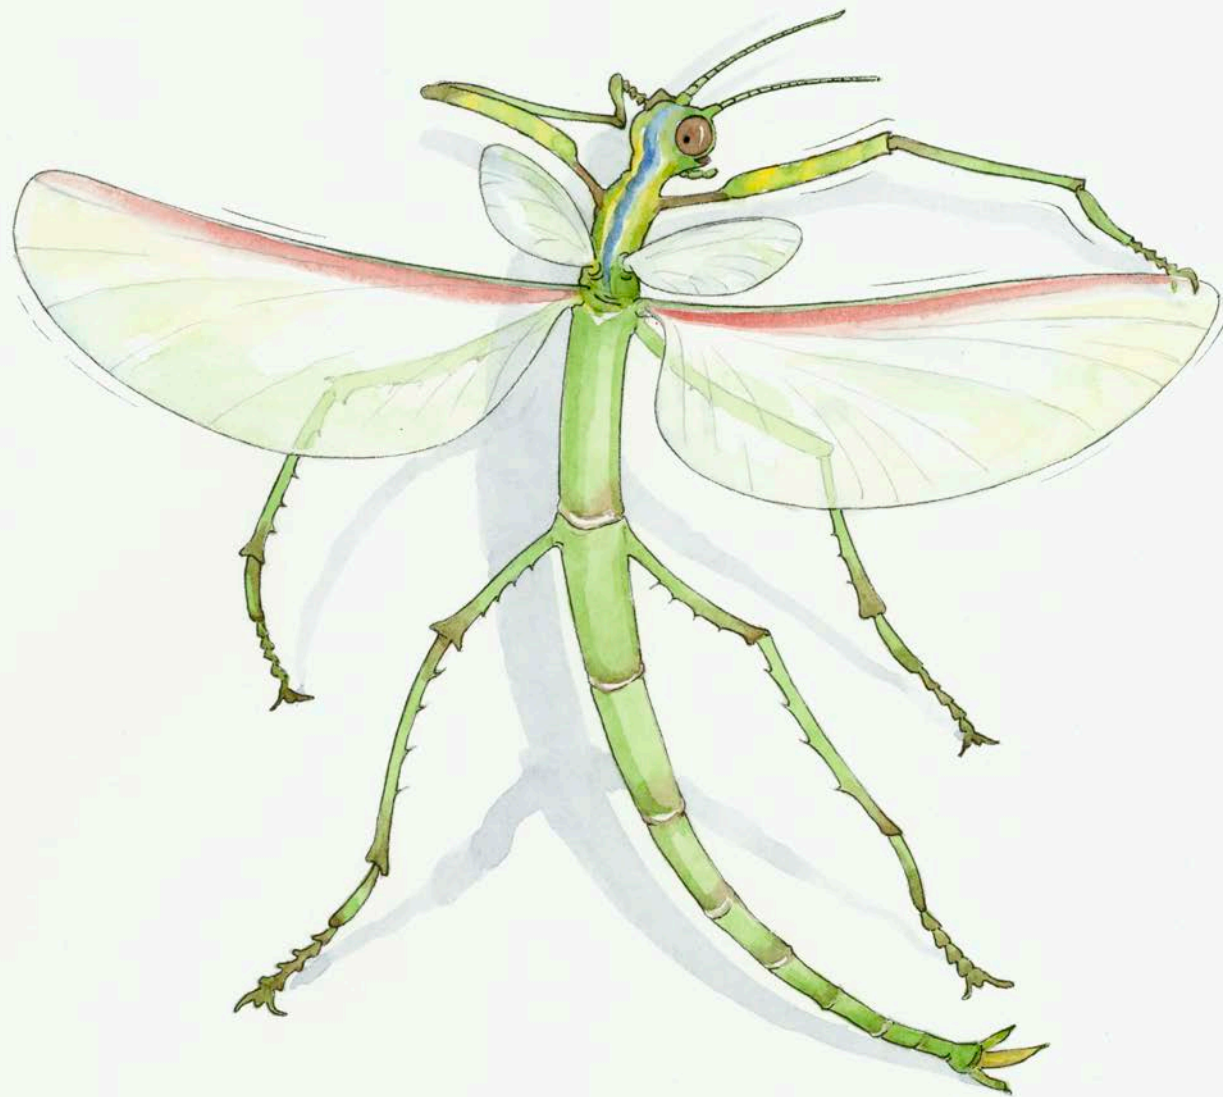

Like all insects, Stick Insects
must shed their skin to grow.

Billy comes of age –
now he can fly!

Insect's wings become fully functional
when they reach adulthood.

Phew that was close!

Stick Insects rely on camouflage
to escape predators.

Baby is off to a flying start

Female Stick Insects flick
their eggs as they are laid.
